

Thematic Group: Evacuation	
Focus Group: 1.1. Health, social and psychosocial	
Scenario: Alert (yellow alert level)	
Area of action	Contributions to the PAIV and the thematic area
Evacuation planning	- Incorporate coordination mechanisms with the different health and social-health resources in the territory (Canary Health Service, Health Areas, IASS, social-health centers and accommodation establishments, among others), in order to provide a comprehensive assessment of the needs of the potentially affected population - Develop specific information-gathering tools to characterize the social-health situation of the population at risk and facilitate evacuation planning - Previously identify and analyze the needs of vulnerable groups, including medical treatments, dependence on caregivers, specific dietary needs, mental health support, and other relevant factors for evacuation and sheltering - Incorporate territorial and operational variables into evacuation planning, such as geographic location, housing type, availability of human and material resources, accessibility, and characteristics of the affected population - Review in a coordinated manner those operational issues identified as areas for improvement in the PAIV that originate in higher-level planning instruments, in order to ensure coherence among the different emergency and civil protection plans
Health evacuation	- Have up-to-date information on the vulnerable population and their social-health needs in order to prioritize assisted evacuation and ensure continuity of health and social care throughout the process
Preventive evacuation	- Adapt the usual routes and circulation systems to the specific needs arising from a preventive evacuation, ensuring the flow of movements and the safety of the population - Strengthen coordination with security and traffic-management devices to facilitate the orderly execution of assisted evacuation operations

Thematic Group: Evacuation	
Focus Group: 1.2. Infrastructure and logistics	
Scenario: Alert (yellow alert level)	
Area of action	Contributions to the PAIV and the thematic area
Meeting points	- It is recommended that meeting points be large open areas
Pick-up points and coordination with possible destinations	- Clearly and precisely define the differences between meeting points and pick-up points, specifying their objectives and operational procedures - Incorporate into the PAIV a detailed description of the coordination and management mechanisms for meeting and pick-up points, including the distribution of functions among administrations - Specify the minimum human, material, and logistical resources that municipalities must have for the establishment and management of meeting points - Detail the procedures and transportation resources required to transfer people from the pick-up points, including the definition of responsibilities among the competent administrations
Time frame for evacuations	- Maintain the definition of evacuation flows and time frames contemplated in the PAIV for residents, tourists, and health evacuations - Specify more clearly the moment when each of the planned time frames is activated, defining its relationship with the different alert scenarios and with the evolution of the volcanic phenomenon - Incorporate objective criteria that allow certain evacuations to be anticipated before the activation of more severe scenarios, taking into account the uncertainty inherent to eruptive processes
Evacuation routes	- Incorporate into the PAIV the existing agreements, plans, or protocols related to the mobilization of collective transport resources for evacuations - Evaluate and incorporate maritime evacuation as an operational alternative in those scenarios in which land routes may be compromised or isolated - Analyze the operational capacity of ports located in risk areas for use as evacuation points for people and as entry points for emergency resources - Establish specific protocols for the activation and coordination of maritime evacuation and supply operations

Evacuation of tourists	- Expand the scope of tourism planning by incorporating modalities not expressly contemplated in the PAIV, such as active tourism, excursions from other tourist areas, and vacation rentals - Establish specific procedures for the identification, location, and evacuation of visitors staying outside traditional hotel establishments - Strengthen coordination with tourism agencies on other islands to facilitate temporary accommodation alternatives for tourists who cannot remain on the affected island and who also do not wish to return to their places of origin
Evacuation of companion animals	- Specify in the PAIV the information and documentation requirements that must accompany evacuated animals, including identification, health history, veterinary treatments, and specific needs - Expressly incorporate the functions and responsibilities of the specialized organizations responsible for the management and care of animals during evacuations - Develop the planned protocol for the evacuation and sheltering of companion animals whose owners do not have their own means of transport - Establish specific procedures for the management of animals from animal protection centers and other shelter facilities
Evacuation of farm animals	- Complete and develop the specific evacuation plan for production animals contemplated in the PAIV - Maintain an updated census of livestock farms, species present, and number of animals potentially affected - Previously identify the farms that have their own evacuation means and those that will require external support - Prepare and update an inventory of transport means and logistical resources available for the evacuation of production animals - Determine in advance the alternative destinations for the temporary relocation of evacuated animals, including receiving farms, public facilities, and other resources enabled for this purpose - Define specific procedures for those species whose management requires differentiated solutions, such as certain poultry or swine productions

Thematic Group: Evacuation	
Focus Group: 1.3. Security	
Scenario: Alert (yellow alert level)	
Area of action	Contributions to the PAIV and the thematic area
Security forces	- Explicitly designate the person responsible for coordinating the Cabildo security group, - Incorporate a clearly identified point of contact to facilitate communication, resource mobilization, and coordination among intervening organizations - Improve the internal dissemination of the designations and operational responsibilities provided for in the plan, ensuring that all organizations involved know the reference persons and established coordination channels - Incorporate evacuation coordination among institutions, which must be established according to the jurisdictional demarcation (State Security Forces and Corps) - Incorporate specific self-protection protocols for the response teams, adapted to the different hazards associated with the volcanic phenomenon - Establish permanent communication mechanisms between the scientific committee and operational organizations to transmit updated recommendations on risks, preventive measures, and safety conditions - Ensure that deployed personnel have updated information on exposure to gases, ash, geological phenomena, and other risks that may affect their safety during operations
Traffic-control criteria	- Break down and define individually the criteria used for locating traffic and access-control devices. Avoid generalities in the PAIV - Incorporate additional criteria that allow the location of control devices to be adapted to the specific characteristics of each emergency scenario
Confinement	- Expand the network of shelters planned for emergency situations, incorporating additional infrastructure that allows the evacuated population to be better distributed - Consider incorporating different types of shelter infrastructure, sports halls, and other facilities capable of housing large population contingents - Prioritize the location of shelters in areas close to evacuation zones, provided that safety conditions allow, in order to speed up transfers and facilitate operational management - Incorporate specific criteria for sheltering people accompanied by animals, promoting an adequate distribution of accommodation resources

Custody of evacuated areas	- Review the model for organizing security in evacuated areas, defining differentiated functions for the different police forces and emergency organizations in order to avoid duplication and ensure a clear distribution of responsibilities - Establish specific procedures for the protection of property, access control, and surveillance of evacuated areas - Integrate technological means of remote surveillance, such as drones, cameras, or other monitoring systems, for the supervision of difficult-to-access areas or areas with high levels of risk for responders - Incorporate these resources as a complement to on-site surveillance, especially in scenarios with the presence of gases, high temperatures, or proximity to the eruptive phenomenon
-----------------------------------	---

Thematic Group: Evacuation	
Synthesis of the Thematic Group	
Scenario: High-Alert (Orange Phase)	
Evacuation strategies	Contributions to the maximum alert scenario and preventive evacuation of a first population center
Self-evacuation	- Maintain the greatest possible permeability of evacuation routes, minimizing traffic restrictions and ensuring exit alternatives in both directions when safety conditions allow - Establish strategic traffic and access-control points to regulate mobility, manage evacuation flows, and restrict entry to the affected areas - Prioritize the TF-5 as the main evacuation and mobility axis, ensuring its operability and capacity during the different phases of the emergency - Strengthen the signage of routes, meeting points, and safe areas in population centers, using reference locations such as squares, main avenues, and other high-visibility spaces - Ensure coordination among security, logistics, and human-resource management devices, establishing staff relief and rotation systems adapted to the operational needs of the emergency (shifts of between 2 and 4 hours are proposed) - Ensure the sufficient availability of food-supply resources and personal protective equipment (PPE) for response personnel - Updated communication through the Advanced Command Post (ACP)

Directed evacuation	- Incorporate preliminary estimates of the evacuable population to facilitate the planning of transport, reception, and assistance resources, taking as a reference an evacuation scenario of approximately 10% of the potentially exposed population. A scenario of 6,000 inhabitants is established, so around 600 people would require directed evacuation (information provided by the ACP) - Set up pick-up points in the main population centers, prioritizing those with greater concentration capacity and accessibility, such as El Tanque, Garachico, and other settlements with similar characteristics - A meeting and logistical coordination point is established in La Orotava for the reception, distribution, and referral of evacuated people to the corresponding reception resources. - Plan the evacuation of the population through successive phases or stages, taking into account the meeting points established in the PAIV - The role of municipal grouping devices comes into play; these are municipal devices that facilitate the evacuation of small dispersed or isolated groups of the population. There must be a directory of drivers to perform this function up to the established meeting point. A first registration is carried out by a response staff member - A directory of evacuation resources must be implemented with TITSA and possible private means with which collaboration would need to be established for the evacuation - Provide resources for companion animals at the pick-up points - Establish the TF-5 as the main evacuation route for the centers located along the coastal strip and the TF-1 for the settlements located in the northern area - Control possible bottlenecks caused by traffic closures - The evacuation of tourists located in the coastal area is carried out using transport specifically for them. They also go to the meeting point, being distributed to other hotels on the island - Have an updated directory of hotels and vacation rentals that could receive evacuated visitors (vacation rentals are evacuated as local population) - Properly organize the timing of self-evacuation (previous group) and directed evacuation to avoid overlaps and bottlenecks - The evacuation of farm animals would be carried out depending on the capacity to do so during evacuation and directed evacuation or afterward
Assisted evacuation	- It is organized for a scenario of 50 patients with different pathologies - Assistance adapted to their autonomy and mobility is contemplated, not for people requiring urgent medicalized assistance - Adapt transport means to the current situation of the different patients - Do not remove resources from the ordinary service - Prioritize assisted evacuation through assessment criteria that consider, first, the level of risk existing in the affected area, followed by the degree of mobility of people and, subsequently, their health needs or specific pathologies - Assign to the health coordination officer of the Advanced Command Post (ACP) the management of the resources required for assisted evacuation, including the request for transport means, logistical support, escorts, and any other resource required to ensure safe transfers. The route established by the Local Police is followed - Incorporate into assisted evacuation planning operational variables such as the clinical profile of the affected persons, the condition and capacity of evacuation routes, proximity to the eruptive phenomenon, and meteorological conditions, in order to adequately estimate response and transfer times - Establish as an operational reference a time horizon of between four and five hours to complete the evacuation of people with assistance needs, subject to the specific conditions of the emergency and the availability of resources - Ensure that coordination of assisted evacuation is carried out centrally from the Advanced Command Post (ACP), with the support of CECOES 112 when the magnitude or complexity of the emergency so requires - Integrate psychological care teams from the initial phases of the evacuation process, ensuring their presence at pick-up points to provide emotional support and accompaniment to affected persons and responders
