

THEMATIC GROUP	ANALYTICAL DIMENSION OF RISK GOVERNANCE
SHELTER AND SOCIAL AND HEALTH CARE ASSISTANCE	MULTILEVEL INTERACTIONS
	Vertical coordination, distribution of authority and responsibilities, interaction across scales, decision-making and information flows, and articulation between formal coordination structures and multiple decision-making centers
	It is recommended to verify the degree of development, updating, and implementation of municipal action plans, in order to ensure their operability and alignment with the procedures established for emergency management
	Define more precisely the functions, responsibilities, and competencies of CECOPIN and municipal CECOPALs. Greater clarification of these functions would facilitate the development and updating of municipal action plans
	Strengthen the definition of communication and coordination mechanisms between CECOPIN and the CECOPALs by establishing permanent and bidirectional information flows
	Clearly define the authority responsible for shelter security, assigning command and coordination functions to the competent security body according to the territorial scope of action
	clearly define the organizations responsible for identification and registration processes, establishing their specific functions
	Ensure the coordinated provision of psychological, health, and social care in shelters
	Keep population records and databases updated, incorporating relevant information for evacuation planning, estimating sheltering needs, and identifying groups with specific assistance requirements.
	Periodically review estimates of the potentially evacuable population and demand for shelter places, in order to adapt resource planning to the demographic reality of the territory.
	Logistical coordination: communication among administrations, Ashotel application for managing available hotel places
	External environment: coordination with logistics for traffic closures/alternative routes
	Unified command: representative from each body in the central control
	ACTORS AND NETWORKS
	Diversity of actors and participation, formal and informal networks, cooperation among actors, shared learning, distributed leadership, and network governance
	Explicitly incorporate into the plan entities specialized in caring for people with disabilities and other support needs, such as the Tenerife Isla Solidaria initiative and the participation of reference organizations such as SINPROMI, in order to strengthen comprehensive care for the most vulnerable groups
	Develop and implement specific technological tools for the registration and recordkeeping of affected people, taking as a reference systems already used by organizations specialized in humanitarian assistance and emergency management
	Assess the incorporation of private security services as a complement to public surveillance units
	Incorporate specific measures for the sheltering and management of animals during evacuations, considering differentiated resources according to their type (companion animals, livestock, wildlife under custody, exotic species, or other animals dependent on evacuated people), in order to facilitate evacuation and reduce risk situations or refusal to evacuate
	Volunteering: essential (90% in logistics). Prior training, no spontaneous volunteers. Need for a clear organizational chart (e.g., Red Cross as command)
	Reception and registration: personal data, diagnoses, allergies, primary and secondary transportation (Red Cross, SUC).
	Coordination: volunteer call center, adaptation to circumstances
	Establish agreements with the hotel and tourism sector to provide medium-term accommodation
	FORMAL AND INFORMAL INSTITUTIONS
	Formal rules, protocols, procedures, institutional legitimacy, informal arrangements, and institutional adaptation
	The procedures included in the PAIV are considered consistent with the operational needs of the alert phase
	Carry out registration and recordkeeping processes in reception centers, where there is greater capacity for control, supervision, and management of information on evacuated people
	Enable adapted spaces and resources for groups with specific needs, including people with disabilities, transgender people, women who are victims of gender-based violence, and other groups that may require differentiated conditions of accommodation, care, or protection
	Conceptually differentiate between disability and dependency, incorporating specific care protocols for each situation and recognizing the diversity of existing support needs
	Consider different vulnerability profiles, including people with visual, hearing, physical or motor, cognitive, intellectual, or psychosocial disabilities, as well as people with specific dietary needs, anxiety disorders, phobias, or other circumstances that may affect their well-being during evacuation and shelter stays
	Establish assessment criteria that allow resources and supports to be adapted to the different degrees of dependency and levels of autonomy of affected people
	Develop specific internal security protocols regulating aspects such as access control, coexistence, limitations on the use of certain spaces, and custody of personal belongings
	establish a phased registration system that allows an initial registration to be generated during the evacuation process and the information to be completed upon arrival at the shelter
	design standardized forms for the uniform collection of data on evacuated people

	implement individual identification systems during transfers through mechanisms such as wristbands or other solutions that facilitate the traceability of evacuated people
	expand the information collected in registration forms to include data relevant to the care and protection of the people housed, such as regular medication, specific support needs, home address, or contact persons
	design differentiated and controlled entry and exit circuits, limiting entry and exit points to those strictly necessary to facilitate control, security, and occupancy monitoring tasks
	set up control points for the basic registration of objects and belongings brought into shelters
	provide secure spaces for the temporary deposit and custody of valuable items belonging to the people housed
	provide differentiated accommodation areas for people accompanied by animals and for those who are not
	Arrival at the shelter: registration point, classification (health-related, second homes, sheltered persons, families, vulnerable persons, pets). Sectors and access control
	Nearby but independent CRM: daily record of entries/exits, food coordination to avoid waste
	Controlled access: single entry point, complete registration, valuables and prohibited items
	Custody area: designated person responsible and registration sheet
	Internal security: private surveillance, coexistence schedules
	Violent behavior: relocation and separation of conflictive persons
	Differentiated spaces: by gender, breastfeeding, persons with reduced mobility, adapted bathrooms; possible modification of structures.
	Medication and diets: review of treatments, electronic prescriptions, care for diabetics, people with allergies, etc.
	Vulnerable groups: women who are victims of gender-based violence, homeless people, addictions, chronic/mental illnesses...
