

Highlighted contributions presented by the Cabildo during the Institutional Evaluation

Theme	No. of contributions	Highlighted contributions
Coordination	37	• The existence of a clear command structure, the effective activation of evacuation protocols, and collaboration between administrations was recognised. • The technical response was positively assessed, although a lack of operational leadership was identified in some scenarios. • Weaknesses persist in vertical coordination, the integration of certain actors, and the rigidity of emergency plans. • Most contributions were constructive, although bottlenecks and limited flexibility in the operation of the Scientific Committee were identified.
Alert system and communication	16	• ES-Alert was considered effective because of its simplicity and clarity of use. • Technical limitations in radio communications were identified. • Accessibility problems in mobile communications due to poor coverage were detected. • The communication strategy needs to be more inclusive, anticipatory, and educational.
Emergency plan	19	• The technical implementation of the emergency plan was considered adequate. • Logistical shortcomings in the assistance provided to vulnerable groups were identified. • The consistency between PEVOLCA, the PAIV and the municipal emergency plans should be reviewed. • The emergency plans functioned well from a structural perspective but require improvements in their human dimension.
Emergency operations	18	• Most contributions were forward-looking, providing clear suggestions regarding roles, communication, command, and public information. • It was proposed to define responsibilities more clearly and to sectorise the Advanced Command Post. • The operational effectiveness of the Scientific Committee should be improved. • The need to incorporate aspects such as pet evacuation and the sectorisation of command posts was highlighted. • There was a clear consensus regarding the areas requiring improvement.
Citizen participation and preparedness	13	• Voluntary participation was considered high and committed. • It is necessary to strengthen public training on how to act during emergencies. • Pre-emergency training for responders should be reinforced and participation channels expanded. • Emergency preparedness should adopt a community-based approach.

Initial conclusions from the institutional evaluation

- The operational recommendations collected following the Tenerife MODEX exercise reflect a high level of technical and strategic analysis by the participants.
- The contributions show that, although the technical structure functioned effectively, the exercise needs to progress towards a more human-centred, inclusive, and educational approach
- Citizens are prepared to participate, but they require training, clear participation channels, and a narrative that recognises them as active participants.

A total of 67 operational recommendations were issued, related to the following areas:
Organisational structure of PEVOLCA • Integrate key actors and clarify institutional roles. • Strengthen the chain of command.
Communication and alert systems • Validate multiple and inclusive early warning channels. • Maintain analogue backup communication systems.
Infrastructure, logistics and operations • Relocate healthcare areas to ensure privacy. • Develop sustainability plans for emergency responders, including staff replacement arrangements.
Social care and vulnerable groups • Designate a social care focal point within the Advanced Command Post (ACP). • Carry out the registration process at the relocation site with the support of social workers.
Training, participation and emergency culture • Train community leaders as local self-protection focal points. • Develop accessible and multilingual public information campaigns. • Prepare practical guidance on water conservation and the use of basic resources.
Innovation and continuous improvement • Professionalise drone operators and conduct regular training exercises.
